

Glass Beads For Coating

Technical Data Sheet (TDS)

Glass Beads For Coating

glass beads are used in paints and coatings improving scratch, abrasion resistance, washability and enhancing the surface aspect properties in topcoats and sealers. Thanks to their shape and ball bearing effect, the glass beads improve the fluidity and the ease of application in various applications (epoxy flooring, polyester coating, SMC/BMC...).

solid glass beads are used alone or combined with other additives in paints and coatings. Solid glass beads appear like a white powder but are in reality perfect spheres of soda lime glass. The glass beads are coated with a coupling agent, providing solid bonding between glass and resin and enhancing dispersion of the beads in the matrix.

Coating Solutions

Wood Protection

Emulsion Building

Industrial Paints & Puties

Thin Layers & Adhesives Sealants

Size: 0-30micron

Packing: 25kgs/bag
