

Citilog: Expertise and turnkey solutions for Video Surveillance

With over 15 years of expertise in Automated Video Incident Detection, Citilog has proven experience in video surveillance and today offers turnkey video surveillance solutions incorporated in a new video management system called **MediaVMS**.

MediaVMS is a powerful open video management platform that integrates video analytics (intrusion detection, incident detection, license plate recognition, etc.), into the day to day management of your video system across a wide range of various business activities.

Video Surveillance on roadways - Automatic Incident Detection and License Plate Recognition / Enforcement

MediaVMS is fully compatible with Citilog's Automatic Incident Detection for roads, bridges and tunnels as well as License Plate Recognition. Citilog can supply a comprehensive and turnkey video surveillance and video detection system.

By providing automated and rapid response to incidents in conjunction with the overall video surveillance, road safety, security and mobility is greatly increased.

Urban Video Surveillance

MediaVMS offers a wide range of solutions to answer the needs for smart video surveillance for cities and agencies in urban environments.

Robust and vandal-proof cameras as well as smart video solutions such as intrusion detection, license plate recognition or enforcement are much needed tools to enforce a safe and secure environment for citizens.

Video Surveillance of sensitive sites - Intrusion Detection

MediaVMS is an ideal platform to monitor sensitive sites such as malls, sport arenas, plants, public and military buildings. Automatic intrusion detection solutions combined with an intelligent scenario management allows for efficient monitoring of these infrastructures.

MediaVMS Video Management System

MediaVMS is a Video Management System enabling management and operation of video surveillance equipment, such as cameras, encoders, recorders, transmission, video walls and monitors.

With 8 years of experience in the integration of IP video streams, Citilog has an unmatched expertise in reliable and efficient management of IP video as well as analog video streams.

Smart management of the Video Surveillance System

More than just a simple system for transmission and distribution of video streams, **MediaVMS** allows for the automated and efficient monitoring of sites through the combined use of Video Analytics and an elaborate scenario management system.

Video Analytics can be deployed according to the needs of a given site and may include: automatic incident detection on roadways, intrusion detection, automatic license plate recognition, and enforcement systems (red-light running, speeding, access control).

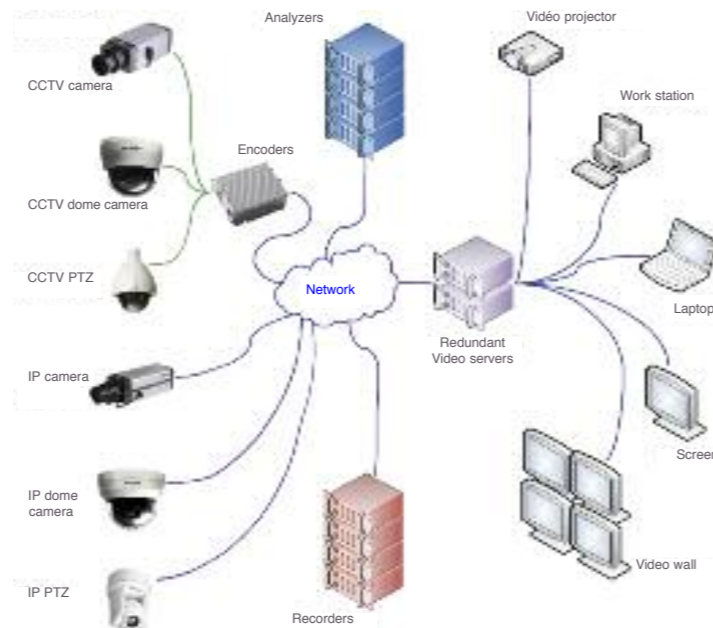

MediaVMS is designed around a modular and open architecture compatible with all brand name manufacturers of video equipment as well as many local manufacturers.

MediaVMS can activate complex response scenarios either manually by the operator or automatically by the video analytics, to include: simultaneous recording of several cameras, dynamic routing of a video stream onto a video wall, zoom of a PTZ camera to the incident spot or sending an alarm to a Smartphone or a tablet.

A secure and modular architecture

Key components of the system (video server, video analyzers, video recorders) can be designed as redundant systems, thus allowing uninterrupted operation in case of an equipment failure.

MediaVMS is designed to communicate with 3rd party SCADA and ATMS systems and offers a comprehensive SDK allowing management of the whole system by a 3rd party application.
